

Sobre - Family Finance for OFWs

One-liner: A joint account for families living worlds apart.

Problem and Solution

The gap:

Philippine OFW households received a record of \$35.6 billion in remittances in 2025, equivalent to 7.3% of national GDP (BusinessWorld Online, 2026). Despite this, the money consistently fails to build lasting financial security.

Pain points:

- **96% of remittances are consumed by food and basic household needs**, leaving almost nothing for savings or goals (Inquirer News, 2023)
- 8 in 10 OFWs return home with no savings after years of working abroad (GMA News Online)
- Nearly 1 in 5 OFW-dependent families regularly runs out of money before the next remittance arrives, and 72% respond by calling the OFW for more (Rappler, 2019).
- 25% of remittances go directly to loan repayments, consuming the portion that should be building household assets (Ateneo de Manila University, 2020).
- Financial conversations between OFWs and their families are routinely avoided out of guilt, fear of conflict, and cultural pressure which results in no shared plan and no accountability (CreditKaagapay, 2025).
- Guilt and distance drive OFWs to overspend on gifts, pasalubong, and unplanned requests, derailing any existing financial plan (AIA Philippines).

The Solution:

[Product name] gives OFW families what traditional banks never could – a joint account you open on your phone in minutes, from anywhere in the world.

Here is how it works:

Your money is split the moment it arrives.

Before your remittance lands, you decide: \$6,000 for groceries, \$5,000 for tuition, \$2,000 for emergencies, \$3,000 for savings. The moment your money arrives, it goes straight into these envelopes automatically,

Everyone only spends from what you assigned them.

When you set up the wallet, you decide who gets access to which envelope. Your spouse is linked to the grocery envelope, they can only see that balance and spend from it. Your parents are linked to the utilities envelope, same rule applies. No one can touch an envelope that was not assigned to them, and no one can move money out of their envelope without it showing up on your dashboard. If your spouse tries to access the tuition envelope, they simply cannot. The boundaries are set by you and the app holds them.

Big purchases need your approval first.

You set a spending limit per envelope. Anything above that amount is held until you approve it from your phone. Your family member makes the request, you get a notification, you tap approve or decline.

Every transaction is visible.

Every peso spent — when, where, by whom, and from which envelope — shows up on your dashboard in real time.

Your savings earns interest.

Money sitting in your savings envelope earns interest, competitive rates with most traditional bank accounts in the Philippines.

A coach that helps you plan and then sets it up for you.

Want to buy a house in five years? Worried about what happens when your contract ends? The built-in financial coach answers those questions based on your family's actual numbers. When you agree on a plan, it updates your envelopes automatically.

Build Scope

P0 — Must Ship (5 features)

These are your entire hackathon. Nothing else until all five work end-to-end.

1. Shared Wallet + Member Link

- Any member creates the wallet, gets a shareable invite link
- Up to 2 members for the demo (OFW + one family member)
- One admin role for managing allocation rules, both members have full visibility
- Same wallet, same data, two devices

2. Envelope Setup

- 3 fixed envelopes: Groceries, Tuition, Savings
- Admin sets percentage split (e.g., 50 / 30 / 20)
- Pre-loaded defaults — setup under 60 seconds
- No custom envelope creation for hackathon

3. USDC Inflow → Auto-Split ★ Hero Moment

- Any member triggers a USDC transfer on Stellar testnet
- App detects inflow, splits into envelopes per the set percentages
- Both dashboards update in real time
- This is the one feature that must be flawless — it's your wow moment on stage

4. Shared Dashboard (Equal Visibility)

- Both members see: all 3 envelopes, total balance, full transaction feed
- Spend button per envelope — logs transaction, deducts from that envelope
- Both views reflect the same live data
- No restricted views — it's a joint account, treat it like one

5. Transaction Feed

- Simple list: who spent, how much, which envelope, when
 - Both members see everything
-

P1 — Ship If Time Allows

These are real integrations now — not mocks. Both sandboxes are accessible without KYB approval.

Transak On-Ramp (Real Staging)

- Transak has a full staging environment at global-stg.transak.com
- No KYB needed — staging API key is available immediately after creating a Partner account
- Embed the widget, point it at Stellar testnet, trigger a real simulated fiat → USDC flow
- This upgrades your demo from "here's what it would look like" to actually working

MoneyGram Ramps Off-Ramp (Real Sandbox)

- MoneyGram Ramps runs natively on Stellar + USDC — zero bridging needed, perfect stack alignment
 - Sandbox setup takes about 5 minutes at developer.moneygram.com, credentials are immediate
 - Show a real sandbox off-ramp confirmation with a reference number, not a static screen
 - This is a strong demo moment: cash out to 170+ countries from the same wallet
-

P2 — Demo With Mock

Approval Gate UI

- Show a static "Pending Approval" screen when a transaction exceeds a set threshold
- No logic required — just the UI to tell the product story
- Worth showing to hint at the roadmap without building it

Yield Display

- Static label: "Est. 4.5% APY" on the Savings envelope
- Zero build cost, adds polish

Onboarding Flow

- Welcome screen + wallet setup walkthrough
- Functional wireframe quality is enough — first impression matters for judges
